

NODEJS: Crash Course

by
Sergii
Tsegelnyk

APPLICATION ARCHITECTURE

Start with npm init

```
Sergiis-MacBook-Pro-2:test-project serg$ npm init
This utility will walk you through creating a package.json file.
It only covers the most common items, and tries to guess sensible defaults.
```

```
See `npm help json` for definitive documentation on these fields
and exactly what they do.
```

```
Use `npm install <pkg> --save` afterwards to install a package and
save it as a dependency in the package.json file.
```

```
Press ^C at any time to quit.
```

```
name: (test-project)
```

```
version: (1.0.0)
```

```
description:
```

```
entry point: (index.js)
```

```
test command:
```

```
git repository:
```

```
keywords:
```

```
license: (ISC)
```

```
About to write to /Users/serg/projects/ciklum/rdss/fe/temp/test-project/package.json:
```

```
{
  "name": "test-project",
  "version": "1.0.0",
  "description": "",
  "main": "index.js",
  "scripts": {
    "test": "echo \"Error: no test specified\" && exit 1"
  },
  "author": "Sergii Tsegelnyk <dr3am3r.ua@gmail.com> (http://serhiy.co/)",
  "license": "ISC"
}
```

```
Is this ok? (yes)
```

Use a smart .npmrc

- ✦ create .npmrc file in a project root
- ✦ define needed things i.e.

```
Sergiis-MacBook-Pro-2:architecture serg$ cat .npmrc  
save=true  
save-exact=true
```

Stick with lowercase

- ✦ `let MyClass = require('my-class');`
- ✦ `MyClass.js` and `myclass.js` will be treated differently across platforms

Avoid garbage

- ✦ node (V8) uses a lazy and greedy garbage collector
- ✦ it sometimes waits until it absolutely has to before reclaiming unused memory
- ✦ you can provide flags for V8:
- ✦ `node --optimize_for_size --max_old_space_size=920 --gc_interval=100 server.js`
- ✦ for more control you can call GC manually, i.e.
- ✦ `node --expose-gc server.js`

Use Clusterisation

- ✦ node runtime is limited to a single CPU core
- ✦ and about 1.5 GB of memory
- ✦ on a large server bake Cluster support into your app
- ✦ choose a cluster abstraction for your needs, i.e. forky, throng, etc

Be environmentally aware

- ✦ leverage the usage of environment variables with `.env`
- ✦ best practice: DO NOT put it in git
- ✦ use loader for it, like `dotenv` (`npm i dotenv`)

Utilise npm's lifecycle scripts

- ✦ before: `preinstall`
- ✦ after: `postinstall`
- ✦ "postinstall": "if [\$BUILD_ASSETS]; then npm run build-assets; fi"
- ✦ "build-assets": "bower install && grunt build"

Remove shit from git

- ✦ create .gitignore and put unnecessary stuff there
- ✦ i.e. node_modules, npm-debug.log, etc

Use CommonJS Power

- ✦ Create index.js in the root of a directory
- ✦ `require('./path/to/dir')`
- ✦ alternative: `NODE_PATH=.`
- ✦ then anywhere `require('app/stuff/morestuff')`

Encapsulate reusable parts

- ✦ Keep them in a separate repository
- ✦ Cover with tests
- ✦ Declare in package.json
- ✦ Versioning as a bonus

Consuming modules

- ✦ Define your way (callback, promises, generators)
- ✦ Keep it consistent throughout an Application
- ✦ Jsdoc generation will save time for newcomers

File structure

- ✦ DO NOT overcomplicate: keep it relevant
- ✦ By component, by type, mixed
- ✦ Number of layers depends on the App complexity

Examples in ExpressJs

- ✦ Routes-Handlers-Models
- ✦ Routes-Handlers-Services-Models
- ✦ Routes-Handlers-Services-MoreServices-...
- ✦ take a look at KrakenJs

Use general rules of good coding

- ✦ Keep functions small and testable
- ✦ Keep modules small
- ✦ If something gets too big - separate it
- ✦ Apply coding standards
